

Amendments to the claims:

1. (currently amended) A hand router (10), comprising:

having a housing (12); and

a tool (22) attached to the housing it in a rotary drivable fashion and parallel oriented to a longitudinal axis of the housing (12) in the form of a drill bit or router bit, which is operable ~~it is possible to operate~~ in the intended manner by means of a suction air flow suppliable~~[[,]] in particular by means of~~ a vacuum cleaner,

wherein a suction air-drivable turbine with a radial or Pelton turbine wheel (32) is used as the drive within the housing (12), wherein said turbine is provided with means for calming any of the air flowing in said turbine wheel (32) and/or flowing out of said turbine wheel (32), whereby the means are comprised of an extra inlet and an extra outlet grating (30, 26), in particular an inlet and outlet grating (30, 26), is used as the drive, the housing (12) being comprised of a number of tube-like parts (13, 14, 15), which ~~it is possible to axially connect~~ wherein said tube-like parts are connectable with one another by means of flanges (36, 38), and wherein one of the tube-like parts (14) in a lower region of the housing (12) encompasses the tool (22) concentrically, wherein the outlet grating (26) has air-conveying elements (28) that are embodied in the form of curved vanes, and wherein the inlet grating (30) and the outlet grating (26) each are incorporated into a motor housing (13) in a manner that reinforces the housing.

2. (canceled)

3. (canceled)

4. (currently amended) The hand router as recited in claim 1 ~~one of the preceding claims~~, wherein the outlet grating (26) serves as a bearing seat for the turbine wheel (32).

5. (canceled)

6. (currently amended) The hand router as recited in claim 1 ~~one of the preceding claims~~, wherein the suction air flow comprised of low-dust air used for driving the turbine wheel (32) is routed separately from a dust air flow so that dust-laden air sucked from a work piece does not come into contact with moving parts of the hand-guided power tool and/or parts of the power tool that convey the driving air.

7. (currently amended) The hand router as recited in claim 1 ~~one of the preceding claims~~, wherein the air used for driving the turbine wheel (32) travels into the housing (12) via air inlet openings (19) ~~(60)~~ that are situated far above the tool (22).

8. (currently amended) The hand router as recited in claim 1 ~~one of the preceding claims~~, wherein the housing (12) has a radio switch that is able to actuate a counterpart switch that switches the vacuum cleaner on and off and it is thus possible to switch the hand power tool on and off at the same time.

9. (currently amended) The hand router as recited in claim 1 ~~one of the preceding claims~~, ~~wherein it has~~ further comprising a switch for speed adjustment[[,]] in particular the form of an operating button coupled to a throttle valve situated in the suction air flow.

10. (currently amended) The hand router as recited in claim 1 ~~one of the preceding claims~~, further comprising a grip region, wherein ~~the~~ a diameter of the grip region (14) corresponds to a diameter ~~that~~ of a vacuum cleaner hose.
